Mark Scheme (Results)

January 2012

GCE Core Mathematics C3 (6665) Paper 1
Edexcel is one of the leading examining and awarding bodies in the UK and throughout the world. We provide a wide range of qualifications including academic, vocational, occupational and specific programmes for employers.

Through a network of UK and overseas offices, Edexcel’s centres receive the support they need to help them deliver their education and training programmes to learners.

For further information, please call our GCE line on 0844 576 0025, our GCSE team on 0844 576 0027, or visit our website at www.edexcel.com.

If you have any subject specific questions about the content of this Mark Scheme that require the help of a subject specialist, you may find our Ask The Expert email service helpful.

Ask The Expert can be accessed online at the following link:

General Marking Guidance

- All candidates must receive the same treatment. Examiners must mark the first candidate in exactly the same way as they mark the last.
- Mark schemes should be applied positively. Candidates must be rewarded for what they have shown they can do rather than penalised for omissions.
- Examiners should mark according to the mark scheme not according to their perception of where the grade boundaries may lie.
- There is no ceiling on achievement. All marks on the mark scheme should be used appropriately.
- All the marks on the mark scheme are designed to be awarded. Examiners should always award full marks if deserved, i.e. if the answer matches the mark scheme. Examiners should also be prepared to award zero marks if the candidate’s response is not worthy of credit according to the mark scheme.
- Where some judgement is required, mark schemes will provide the principles by which marks will be awarded and exemplification may be limited.
- When examiners are in doubt regarding the application of the mark scheme to a candidate’s response, the team leader must be consulted.
- Crossed out work should be marked UNLESS the candidate has replaced it with an alternative response.
EDEXCEL GCE MATHEMATICS

General Instructions for Marking

1. The total number of marks for the paper is 75.

2. The Edexcel Mathematics mark schemes use the following types of marks:

   - **M** marks: method marks are awarded for 'knowing a method and attempting to apply it', unless otherwise indicated.
   - **A** marks: Accuracy marks can only be awarded if the relevant method (M) marks have been earned.
   - **B** marks are unconditional accuracy marks (independent of M marks)
   - Marks should not be subdivided.

3. Abbreviations

   These are some of the traditional marking abbreviations that will appear in the mark schemes and can be used if you are using the annotation facility on ePEN.

   - **bod** – benefit of doubt
   - **ft** – follow through
   - **the symbol \[ \] will be used for correct ft**
   - **cao** – correct answer only
   - **cso** – correct solution only. There must be no errors in this part of the question to obtain this mark
   - **isw** – ignore subsequent working
   - **awrt** – answers which round to
   - **SC**: special case
   - **oe** – or equivalent (and appropriate)
   - **dep** – dependent
   - **indep** – independent
   - **dp** decimal places
   - **sf** significant figures
   - **\[ \] The answer is printed on the paper**
   - **\[ \] The second mark is dependent on gaining the first mark**

4. All A marks are ‘correct answer only’ (cao.), unless shown, for example, as A1 ft to indicate that previous wrong working is to be followed through. After a misread however, the subsequent A marks affected are treated as A ft, but manifestly absurd answers should never be awarded A marks.
General Principals for Core Mathematics Marking

(But note that specific mark schemes may sometimes override these general principles).

Method mark for solving 3 term quadratic:

1. **Factorisation**

\[(x^2 + bx + c) = (x + p)(x + q), \text{ where } |pq| = |c|, \text{ leading to } x = \ldots\]

\[(ax^2 + bx + c) = (mx + p)(nx + q), \text{ where } |pq| = |c| \text{ and } |mn| = |a|, \text{ leading to } x = \ldots\]

2. **Formula**

Attempt to use **correct** formula (with values for \(a, b, c\)), leading to \(x = \ldots\)

3. **Completing the square**

Solving \(x^2 + bx + c = 0\):

\[(x \pm \frac{b}{2})^2 \pm q \pm c, \quad q \neq 0, \quad \text{ leading to } x = \ldots\]

Method marks for differentiation and integration:

1. **Differentiation**

   Power of at least one term decreased by 1. (\(x^n \rightarrow x^{n-1}\))

2. **Integration**

   Power of at least one term increased by 1. (\(x^n \rightarrow x^{n+1}\))

**Use of a formula**

Where a method involves using a formula that has been learnt, the advice given in recent examiners’ reports is that the formula should be quoted first.

Normal marking procedure is as follows:

- **Method mark** for quoting a correct formula and attempting to use it, even if there are mistakes in the substitution of values.

Where the formula is not quoted, the method mark can be gained by implication from **correct** working with values, but may be lost if there is any mistake in the working.
**Question No** | **Scheme** | **Marks** |
---|---|---|
1 | (a) Differentiates the \( \ln(3x) \) term to \( \frac{B}{x} \) for any constant \( B \). Note that \( \frac{1}{3x} \) is fine for this mark. | M1 |
| | Applying \( vu' + uv' \), \( \ln(3x) \times 2x + x \) | M1, A1 A1 |
| (b) | Applying \( \frac{vu' - uv}{v^2} \), \( \frac{x^3 \times 4 \cos(4x) - \sin(4x) \times 3x^2}{x^6} \) | M1 A1+A1 A1 |
| | \( = \frac{4 \cos(4x) - 3 \sin(4x)}{x^4} \) | A1 |
| | (9 MARKS) | |

(a) M1 Differentiates the \( \ln(3x) \) term to \( \frac{B}{x} \). Note that \( \frac{1}{3x} \) is fine for this mark.

M1 Applies the product rule to \( x^2 \ln(3x) \). If the rule is quoted it must be correct.
There must have been some attempt to differentiate both terms.
If the rule is **not quoted (or implied by their working)** only accept answers of the form
\( \ln(3x) \times Ax + x^2 \times \frac{B}{x} \) where \( A \) and \( B \) are non-zero constants

A1 One term correct and simplified, either \( 2x \ln(3x) \) or \( x \). \( \ln 3x^2 \) and \( \ln(3x) 2x \) are acceptable forms
A1 Both terms correct and simplified on the same line. \( 2x \ln(3x) + x, \ln(3x) \times 2x + x, x(2 \ln 3x + 1) \) oe

(b) M1 Applies the quotient rule. A version of this appears in the formula booklet. If the formula is quoted it must be correct.
There must have been some attempt to differentiate both terms.
If the formula is **not quoted (nor implied by their working)** only accept answers of the form
\( \frac{x^3 \times 4 \cos(4x) - \sin(4x) \times 3x^2}{(x^3)^2 \text{ or } x^6 \text{ or } x^5 \text{ or } x^9} \) with \( B > 0 \)

A1 Correct first term on numerator \( x^3 \times 4 \cos(4x) \)
A1 Correct second term on numerator \( - \sin(4x) \times 3x^2 \)
A1 Correct denominator \( x^6 \), the \( (x^3)^2 \) needs to be simplified
A1 Fully correct simplified expression \( \frac{4 \cos(4x) - 3 \sin(4x)}{x^4} \), \( \frac{\cos(4x) 4x - \sin(4x) 3}{x^4} \) oe .
Accept \( 4x^{-3} \cos(4x) - 3x^{-4} \sin(4x) \) oe

**Alternative method using the product rule.**

M1, A1 Writes \( \frac{\sin(4x)}{x^3} \) as \( \sin(4x) \times x^{-3} \) and applies the product rule. They will score both of these marks or neither of them. If the formula is quoted it must be correct. There must have been some attempt to differentiate both terms. If the formula is **not quoted (nor implied by their working)** only accept answers of the form \( x^{-3} \times Acos(4x) + \sin(4x) \times \pm Bx^{-4} \)

A1 One term correct, either \( x^{-3} \times 4 \cos(4x) \) or \( \sin(4x) \times -3x^{-4} \)
A1 Both terms correct, \( x^{-3} \times 4 \cos(4x) + \sin(4x) \times -3x^{-4} \).
A1 Fully correct expression. \( 4x^{-3} \cos(4x) - 3x^{-4} \sin(4x) \) or \( 4 \cos(4x) x^{-3} - 3 \sin(4x) x^{-4} \) oe
The negative must have been dealt with for the final mark.
(a) Shape unchanged. The positioning of the curve is not significant for this mark. The right hand section of the curve does not have to cross x axis.

B1 The x- coordinates of P’ and Q’ are -5 and 0 respectively. This is for translating the curve 2 units left. The minimum point Q’ must be on the y axis. Accept if -5 is marked on the x axis for P’ with Q’ on the y axis (marked -12).

B1 The y- coordinates of P’ and Q’ are 0 and -12 respectively. This is for the stretch ×3 parallel to the y axis. The maximum P’ must be on the x axis. Accept if -12 is marked on the y axis for Q’ with P’ on the x axis (marked -5)

(b) The curve below the x axis reflected in the x axis and the curve above the x axis is unchanged. Do not accept if the curve is clearly rounded off with a zero gradient at the x axis but allow small curvature issues. Use the same principles on the lhs- do not accept if this is a cusp.

B1 Both the x- and y- coordinates of Q’, (2,4) given correctly and associated with the maximum point in the first quadrant. To gain this mark there must be a graph and it must only have one maximum. Accept as 2 and 4 marked on the correct axes or in the script as long as there is no ambiguity.

B1 Both the x- and y- coordinates of P’, (-3,0) given correctly and associated with the minimum point in the second quadrant. To gain this mark there must be a graph. Tolerate two cusps if this mark has been lost earlier in the question. Accept (0, -3) marked on the correct axis.
\[
\text{(b) '40' = } 20 e^{1.5t} \rightarrow \quad e^{1.5t} = c
\]
\[
e^{1.5t} = \frac{40}{20} = (2)
\]

Correct order \(1.5t = \ln'2' \rightarrow t = \frac{\ln c}{1.5}
\]
\[
t = \frac{\ln 2}{1.5} = (\text{awrt 0.46})
\]
12.28 or 28 (minutes)

(a)

B1 Sight of 20 relating to the value of A at \(t=0\). Do not worry about (incorrect) units. Accept its sight in (b)

(b)

M1 Substitutes \(A=40\) or twice their answer to (a) and proceeds to \(e^{1.5t} = \text{constant}\). Accept non numerical answers.

A1 \(e^{1.5t} = \frac{40}{20} \text{ or 2}\)

M1 Correct \(\ln\) work to find \(t\). Eg \(e^{1.5t} = \text{constant} \rightarrow 1.5t = \ln(\text{constant}) \rightarrow t = \)

The order must be correct. Accept non numerical answers. See below for correct alternatives

A1 Achieves either \(\frac{\ln (2)}{1.5}\) or awrt 0.46 2sf

A1 Either 12:28 or 28 (minutes). Cao

Alternatives in (b)

Alt 1- taking \(\ln\)'s of both sides on line 1

M1 Substitutes \(A=40\), or twice (a) takes \(\ln\)'s of both sides and proceeds to \(\ln('40') = \ln 20 + \ln e^{1.5t}\)

A1 \(\ln(40) = \ln 20 + 1.5t\)

M1 Make \(t\) the subject with correct \(\ln\) work.

\[
\ln('40') - \ln 20 = 1.5t \quad \text{or} \quad \ln \left(\frac{40}{20}\right) = 1.5t \rightarrow t =
\]

A1,A1 are the same

Alt 2- trial and improvement—hopefully seen rarely

M1 Substitutes \(t=0.46\) and \(t=0.47\) into \(20e^{1.5t}\) to obtain \(A\) at both values. Must be to at least 2dp but you may accept tighter interval but the interval must span the correct value of 0.46209812

A1 Obtains \(A(0.46)=39.87\) AND \(A(0.47)=40.47\) or equivalent

M1 Substitutes \(t=0.462\) and \(t=0.4625\) into \(40e^{1.5t}\)

A1 Obtains \(A(0.462)=39.99\) AND \(A(0.4625)=40.02\) or equivalent and states \(t=0.462\) (3sf)

A1 AS ABOVE

No working leading to fully correct accurate answer (3sf or better) send/escalate to team leader
4

\[ \left( \frac{dx}{dy} \right) = 2\sec^2 \left( y + \frac{\pi}{12} \right) \]

substitute \( y = \frac{\pi}{4} \) into their \( \frac{dx}{dy} = 2\sec^2 \left( \frac{\pi}{4} + \frac{\pi}{12} \right) = 8 \)

When \( y = \frac{\pi}{4}, x = 2\sqrt{3} \), awrt 3.46

\[ \left( y - \frac{\pi}{4} \right) = \text{their } m(x - \text{their } 2\sqrt{3}) \]

\( \left( y - \frac{\pi}{4} \right) = -8(x - 2\sqrt{3}) \) oe

M1 For differentiation of \( 2\tan \left( y + \frac{\pi}{12} \right) \rightarrow 2\sec^2 \left( y + \frac{\pi}{12} \right) \). There is no need to identify this with \( \frac{dx}{dy} \)

A1 For correctly writing \( \frac{dx}{dy} = 2\sec^2 \left( y + \frac{\pi}{12} \right) \) or \( \frac{dy}{dx} = \frac{1}{2\sec^2(y + \frac{\pi}{12})} \)

M1 Substitute \( y = \frac{\pi}{4} \) into their \( \frac{dx}{dy} \). Accept if \( \frac{dy}{dx} \) is inverted and \( y = \frac{\pi}{4} \) substituted into \( \frac{dy}{dx} \).

A1 \( \frac{dx}{dy} = 8 \) or \( \frac{dy}{dx} = \frac{1}{8} \) oe

B1 Obtains the value of \( x = 2\sqrt{3} \) corresponding to \( y = \frac{\pi}{4} \). Accept awrt 3.46

M1 This mark requires all of the necessary elements for finding a numerical equation of the normal.

Either Invert their value of \( \frac{dx}{dy} \) to find \( \frac{dy}{dx} \), then use \( m_1 \times m_2 = -1 \) to find the numerical gradient of the normal

Or use their numerical value of \( -\frac{dx}{dy} \)

Having done this then use \( \left( y - \frac{\pi}{4} \right) = \text{their } m(x - \text{their } 2\sqrt{3}) \)

The \( 2\sqrt{3} \) could appear as awrt 3.46, the \( \frac{\pi}{4} \) as awrt 0.79,

This cannot be awarded for finding the equation of a tangent.

Watch for candidates who correctly use \( (x - \text{their } 2\sqrt{3}) = -\text{their numerical } \frac{dy}{dx} \left( y - \frac{\pi}{4} \right) \)

If they use '\( y = mx + c \)' it must be a full method to find \( c \).

A1 Any correct form of the answer. It does not need to be simplified and the question does not ask for an exact answer.

\( \left( y - \frac{\pi}{4} \right) = -8(x - 2\sqrt{3}) \), \( \frac{y - \frac{\pi}{4}}{x - 2\sqrt{3}} = -8 \), \( y = -8x + \frac{\pi}{4} + 16\sqrt{3} \), \( y = -8x \) (awrt) 28.5
Alternatives using \( \arctan \) (first 3 marks)

**M1** Differentiates \( y = \arctan \left( \frac{x}{2} \right) - \frac{\pi}{12} \) to get \( \frac{1}{1+\left( \frac{x}{2} \right)^2} \times \text{constant} \). Don’t worry about the lhs.

**A1** Achieves \( \frac{dy}{dx} = \frac{1}{1+\left( \frac{x}{2} \right)^2} \times \frac{1}{2} \).

**M1** This method mark requires \( x \) to be found, which then needs to be substituted into \( \frac{dy}{dx} \). The rest of the marks are then the same.

Or implicitly (first 2 marks)

**M1** Differentiates implicitly to get \( 1 = 2 \sec^2 \left( y + \frac{\pi}{12} \right) \times \frac{dy}{dx} \).

**A1** Rearranges to get \( \frac{dy}{dx} \) or \( \frac{dx}{dy} \) in terms of \( y \). The rest of the marks are the same.

Or by compound angle identities

\[
x = 2 \tan \left( y + \frac{\pi}{12} \right) = \frac{2 \tan y + 2 \tan \left( \frac{\pi}{12} \right)}{1 - \tan y \tan \left( \frac{\pi}{12} \right)} \text{ oe}
\]

**M1** Differentiates using quotient rule—see question 1 in applying this. Additionally the \( \tan y \) must have been differentiated to \( \sec^2 y \). There is no need to assign to \( \frac{dx}{dy} \).

**A1** The correct answer for \( \frac{dx}{dy} = \frac{(1-\tan y \tan \frac{\pi}{12}) \times 2 \sec^2 y - (2 \tan y + 2 \tan \left( \frac{\pi}{12} \right)) \times \sec^2 y \tan \frac{\pi}{12}}{(1-\tan y \tan \frac{\pi}{12})^2} \).

The rest of the marks are as the main scheme.

<table>
<thead>
<tr>
<th>Question No</th>
<th>Scheme</th>
<th>Marks</th>

</thead>
<tbody>
<tr>
<td>5.</td>
<td>Uses the identity ( \cot^2(3\theta) = \cosec^2(3\theta) - 1 ) in ( 2\cot^2(3\theta) = 7\cosec(3\theta) - 5 )</td>
<td>M1</td>
</tr>
</tbody>
</table>
2cosec²(3θ) − 7cosec(3θ) + 3 = 0

(2cosec3θ − 1)(cosec3θ − 3) = 0

cosec3θ = 3

θ = \frac{\text{invsin}(\frac{1}{3})}{3}, \quad 19.5° = \text{awrt 6.5°}

θ = \frac{180° - \text{invsin}(\frac{1}{3})}{3}, 53.5°

Correct 2nd value

θ = \frac{360° + \text{invsin}(\frac{1}{3})}{3}

Correct 3rd value

All 4 correct answers awrt 6.5°, 53.5°, 126.5° or 173.5°

M1 Uses the substitution cot²(3θ) = ±1 ± cosec²(3θ) to produce a quadratic equation in cosec(3θ)

Accept ‘invisible’ brackets in which 2cot²(3θ) is replaced by 2cosec²(3θ) − 1

A (longer) but acceptable alternative is to convert everything to sin(3θ).

For this to be scored cot²3θ must be replaced by \(\frac{\cos²(3\theta)}{\sin²(3\theta)}\), cosec(3θ) must be replaced by \(\frac{1}{\sin(3\theta)}\).

An attempt must be made to multiply by sin²(3θ) and finally cos²(3θ) replaced by \(y = \pm 1 \pm \sin²(3\theta)\)

A1 A correct equation (=0) written or implied by working is obtained. Terms must be collected together on one side of the equation. The usual alternatives are

\[2\cosec²(3\theta) - 7\cosec(3\theta) + 3 = 0\]

or

\[3\sin²(3\theta) - 7\sin(3\theta) + 2 = 0\]

dM1 Either an attempt to factorise a 3 term quadratic in cosec(3θ) or sin(3θ) with the usual rules

Or use of a correct formula to produce a solution in cosec(3θ) or sin(3θ)

A1 Obtaining the correct value of cosec(3θ) = 3 or sin(3θ) = \(\frac{1}{3}\). Ignore other values

ddM1 Correct method to produce the principal value of θ. It is dependent upon the two M’s being scored.

Look for \(\theta = \frac{\text{invsin}(\text{their } \frac{1}{3})}{3}\)

A1 Awrt 6.5

ddM1 Correct method to produce a secondary value. This is dependent upon the candidate having scored the first 2 M’s. Usually you look for \(\frac{180° - \text{their } 19.5°}{3}\) or \(\frac{360° + \text{their } 19.5°}{3}\) or \(\frac{540° - \text{their } 19.5°}{3}\)

Note 180-their 6.5 must be marked correct BUT 360+their 6.5 is incorrect

A1 Any other correct answer. Awrt 6.5, 53.5, 126.5 or 173.5

ddM1 Correct method to produce a THIRD value. This is dependent upon the candidate having scored the first 2 M’s. See above for alternatives

A1 All 4 correct answers awrt 6.5, 53.5, 126.5 or 173.5 and no extras inside the range. Ignore any answers outside the range.

Radian answers: awrt 0.11, 0.93, 2.21, 3.03. Accuracy must be to 2dp.

Lose the first mark that could have been scored. Fully correct radian answer scores 1,1,1,1,0,1,1,1,1=9 marks

Candidates cannot mix degrees and radians for method marks.

Special case: Some candidates solve the equation in cosec(θ or x), sin(θ or x) to produce cosec(θ or x) = 3

\[\sin(θ \text { or } x) = \frac{1}{3}\]

<tr>
<td></td>
<td>Change of sign $\Rightarrow x = 1.9078$</td>
<td></td>
</tr>
</tbody>
</table>

(a) M1 Calculates both $f(0.8)$ and $f(0.9)$. Evidence of this mark could be, either, seeing both ‘$x$’ substitutions written out in the expression, or, one value correct to 1 sig fig, or the appearance of incorrect values of $f(0.8) =$ awrt 0.2 or $f(0.9) =$ awrt 0.1 from use of degrees
A1 This requires both values to be correct as well as a reason and a conclusion.
Accept $f(0.8) = 0.08$ truncated or rounded (2dp) or 0.1 rounded (1dp) and $f(0.9) = -0.08$ truncated or rounded as -0.09 (2dp) or -0.1(1dp)
Acceptable reasons are change of sign, $<0$, $0$, $+ve$ $-ve$, $f(0.8)f(0.9) < 0$. Acceptable conclusion is hence root or

(b) M1 Attempts to differentiate $f(x)$. Seeing any of $2x, 3$ or $\pm \sin(\frac{1}{2}x)$ is sufficient evidence.
A1 $f'(x)$ correct. Accept $\frac{dy}{dx} = 2x - 3 - \sin\left(\frac{1}{2}x\right)$
M1 Sets their $f''(x) = 0$ and proceeds to $x = ...$. You must be sure that they are setting what they think is $f'(x) = 0$.
Accept $2x = 3 + \sin\left(\frac{1}{2}x\right)$ going to $x = ...$ only if $f'(x) = 0$ is stated first
A1 * $x = \frac{3 + \sin\left(\frac{1}{2}x\right)}{2}$. This is a given answer so don’t accept just the sight of this answer. It is cso

(c) M1 Substitutes $x_0 = 2$ into $x_{n+1} = \frac{3 + \sin\left(\frac{1}{2}x_n\right)}{2}$. Evidence of this mark could be awrt 1.9 or 1.5 (from degrees)
A1 $x_1 =$ awrt 1.921
A1 $x_2 =$ awrt 1.91 (0) and $x_3 =$ awrt 1.908

(d) Continued iteration is not acceptable for this part. Question states ‘By choosing a suitable interval...’
M1 Chooses the interval [1.90775,1.90785] or tighter containing the root = 1.907845522
M1 Calculates $f'(1.90775)$ and $f'(1.90785)$ or tighter with at least one correct, rounded or truncated $f'(1.90775) = -0.0001$ truncated or awrt -0.0002 rounded
$\quad f'(1.90785) = 0.000076$ truncated or awrt 0.00008 rounded
Accept versions of $g(x)-x$ where $g(x) = \frac{3 + \sin\left(\frac{1}{2}x\right)}{2}$.
When $x = 1.90775$, $g(x) - x = 8 \times 10^{-5}$ rounded and truncated
When $x = 1.90785$, $g(x) - x = -3 \times 10^{-6}$ truncated or $= -4 \times 10^{-6}$ rounded
A1 Both values correct, rounded or truncated, a valid reason (see part a) and a minimal conclusion (see part a). Saying hence root is acceptable. There is no need to refer to the ‘turning point’.

</table>

(a) Factorises the expression $2x^2 + 7x - 4 = (2x - 1)(x + 4)$. This may not be on line 1.
M1 Combines the two fractions to form a single fraction with a common denominator. Cubic denominators are fine for this mark. Allow slips on the numerator but one must have been adapted. Allow ‘invisible’ brackets. Accept two separate fractions with the same denominator. Amongst many possible options are

\[
\frac{3(x+1)-(2x-1)}{(2x-1)(x+4)} \text{, Invisible bracket } \frac{3x+1-2x-1}{(2x-1)(x+4)}
\]

Cubic and separate \[
\frac{3(x+1)(x+4)}{(2x^2+7x-4)(x+4)} - \frac{2x^2+7x-4}{(2x^2+7x-4)(x+4)}
\]

M1 Simplifies the (now) single fraction to one with a linear numerator divided by a quadratic factorised denominator. Any cubic denominator must have been fully factorised (check first and last terms) and cancelled with terms on a fully factorised numerator (check first and last terms).

A1* Cso. This is a given solution and it must be fully correct. All bracketing/algebra must have been correct. You can however accept \[
\frac{y+1}{(x+1)(x+4)} \text{ corresponding to the solution.}
\]

(b)

M1 This is awarded for an attempt to make \(x\) or a swapped \(y\) the subject of the formula. The minimum criteria is that they start by multiplying by \((2x-1)\) and finish with \(x=\) or swapped \(y=\). Allow ‘invisible’ brackets.

M1 For applying the order of operations correctly. Allow maximum of one ‘slip’. Examples of this are

\[
y = \frac{1}{2x-1} \rightarrow y(2x - 1) = 1 \rightarrow 2x - 1 = \frac{1}{y} \rightarrow x = \frac{y+1}{2} \text{ (allow slip on sign)}
\]

\[
y = \frac{1}{2x-1} \rightarrow y(2x - 1) = 1 \rightarrow 2xy - y = 1 \rightarrow 2xy = 1 + y \rightarrow x = \frac{1+y}{2y} \text{ (allow slip on sign)}
\]

\[
y = \frac{1}{2x-1} \rightarrow 2x - 1 = \frac{1}{y} \rightarrow 2x = \frac{1}{y} + 1 \rightarrow x = \frac{1}{2y} + 1 \text{ (allow slip on ÷2)}
\]

A1 Must be written in terms of \(x\) but can be \(y = \frac{14x}{2x} \) or equivalent inc \(y = \frac{7+1}{2}, y = \frac{x+1}{2} = \frac{1}{2x} \), \(y = \frac{1}{2x} + \frac{1}{2}
\)

(c) Accept \(x>0, (0,\infty), \) domain is all values more than 0. Do not accept \(x\geq 0, y>0, [0, \infty], f^{-1}(x) > 0\)

(d)

M1 Attempt to write down \(fg(x)\) and set it equal to 1/7. The order must be correct but accept incorrect or lack of bracketing. Eg \(\frac{1}{2lnx+1-1} = \frac{1}{7}\)

A1 Achieving correctly the line \(\ln(x + 1) = 4\). Accept also \(\ln(x + 1)^2 = 8\)

M1 Moving from \(\ln(x \pm A) = c \) \(A \neq 0\) to \(x = \) The ln work must be correct. Alternatively moving from \(\ln(x + 1)^2 = c \) to \(x = \cdots\).

Full solutions to calculate \(x\) leading from \(gf(x) = \frac{1}{7}\), that is \(\ln \left(\frac{1}{2x-1} + 1\right) = \frac{1}{7}\) can score this mark.

A1 Correct answer only = \(e^4 - 1\). Accept \(e^4 - e^0\)

(4) 
\[
\begin{align*}
\tan(\theta + \frac{\pi}{6}) &= \frac{\tan\theta + \tan\frac{\pi}{6}}{1 - \tan\theta \tan\frac{\pi}{6}} \\
&= \frac{\tan\theta + \frac{1}{\sqrt{3}}}{1 - \tan\theta \frac{1}{\sqrt{3}}} \\
&= \frac{\sqrt{3}\tan\theta + 1}{\sqrt{3} - \tan\theta}
\end{align*}
\]

(3) 
\[
\begin{align*}
\tan\left(\theta + \frac{\pi}{6}\right) &= \tan(\pi - \theta), \\
\left(\theta + \frac{\pi}{6}\right) &= (\pi - \theta) \\
\theta &= \frac{5}{12}\pi \\
\tan\left(\theta + \frac{\pi}{6}\right) &= \tan(2\pi - \theta) \\
\theta &= \frac{11}{12}\pi
\end{align*}
\]

(a) 

**M1**
Uses the identity \( \{ \tan(A + B) = \frac{\sin(A+B)}{\cos(A+B)} = \frac{\sin A \cos B + \cos A \sin B}{\cos A \cos B - \sin A \sin B} \} \) Accept incorrect signs for this. Just the right hand side is acceptable.

**A1**
Fully correct statement in terms of cos and sin \( \{ \tan(A + B) \} = \frac{\sin A \cos B + \cos A \sin B}{\cos A \cos B - \sin A \sin B} \)
Divide both numerator and denominator by $\cos A \cos B$. This can be stated or implied by working. If implied you must have seen at least one term modified on both the numerator and denominator.

**A1** This is a given solution. The last two principal’s reports have highlighted lack of evidence in such questions. Both sides of the identity must be seen or implied. Eg lhs=

The minimum expectation for full marks is

$$\tan(A + B) = \frac{\sin(A + B)}{\cos(A + B)} = \frac{\sin \cos B + \cos A \sin B}{\cos \cos B - \sin A \sin B} = \frac{\sin A}{\cos B} + \frac{\sin B}{\cos A} = \frac{\tan A + \tan B}{1 - \tan A \tan B}$$

The solution $\tan(A + B) = \frac{\sin(A + B)}{\cos(A + B)} = \frac{\sin \cos B + \cos A \sin B}{\cos \cos B - \sin A \sin B}$ ($\div \cos A \cos B$) = $\frac{\tan A + \tan B}{1 - \tan A \tan B}$ scores M1 M1 M0 A0

(b) 

**M1** An attempt to use part (a) with $A = \theta$ and $B = \frac{\pi}{6}$. Seeing $\frac{\tan \theta + \tan \frac{\pi}{6}}{1 - \tan \theta \tan \frac{\pi}{6}}$ is enough evidence. Accept sign slips

**M1** Uses the identity $\tan \left( \frac{\pi}{3} \right) = \frac{1}{\sqrt{3}}$ or $\frac{\sqrt{3}}{3}$ in the rhs of the identity on both numerator and denominator

**A1** cso. This is a given solution. Both sides of the identity must be seen. All steps must be correct with no unreasonable jumps. Accept

$$\tan \left( \theta + \frac{\pi}{6} \right) = \frac{\tan \theta + \tan \frac{\pi}{6}}{1 - \tan \theta \tan \frac{\pi}{6}} = \frac{\tan \theta + \frac{1}{\sqrt{3}}}{1 - \tan \theta \frac{1}{\sqrt{3}}} = \frac{\sqrt{3} \tan \theta + 1}{1 - \sqrt{3} - \tan \theta}$$

However the following is only worth 2 out of 3 as the last step is an unreasonable jump without further explanation .

$$\tan \left( \theta + \frac{\pi}{6} \right) = \frac{\tan \theta + \tan \frac{\pi}{6}}{1 - \tan \theta \tan \frac{\pi}{6}} = \frac{\tan \theta + \frac{\sqrt{3}}{3}}{1 - \tan \theta \frac{\sqrt{3}}{3}} = \frac{\sqrt{3} \tan \theta + 1}{1 - \sqrt{3} - \tan \theta}$$

(c) 

**M1** Use the given identity in (b) to obtain $\tan \left( \theta + \frac{\pi}{6} \right) = \tan (\pi - \theta)$. Accept sign slips

**dM1** Writes down an equation that will give one value of $\theta$, usually $\theta + \frac{\pi}{6} = \pi - \theta$. This is dependent upon the first M mark. Follow through on slips

**ddM1** Attempts to solve their equation in $\theta$. It must end $\theta=$ and the first two marks must have been scored.

**A1** Cso $\theta = \frac{5}{12} \pi$ or $\frac{11}{12} \pi$

**dddM1** Writes down an equation that would produce a second value of $\theta$. Usually $\theta + \frac{\pi}{6} = 2\pi - \theta$

**A1** cso $\theta = \frac{5}{12} \pi \text{ (accept } \frac{\pi}{2.A}) \text{ and } \frac{11}{12} \pi$ with no extra solutions in the range. Ignore extra solutions outside the range.

Note that under this method one correct solution would score 4 marks. A small number of candidates find the second solution only. They would score 1,1,1,1,0,0

**Alternative to (a) starting from rhs**

**M1** Uses correct identities for both $\tan A$ and $\tan B$ in the rhs expression. Accept only errors in signs

$$\frac{\tan A + \tan B}{1 - \tan A \tan B} = \frac{\sin A \sin B}{\cos A \cos B} \div \frac{\cos A \cos B}{\cos A \cos B}$$

**M1** Multiplies both numerator and denominator by $\cos A \cos B$. This can be stated or implied by working. If implied you must have seen at least one term modified on both the numerator and denominator.
This is a given answer. Correctly completes proof. All three expressions must be seen or implied.

\[
\frac{\sin A \cos B + \cos A \sin B}{\cos A \cos B - \sin A \sin B} = \frac{\sin (A + B)}{\cos (A + B)} = \tan (A + B)
\]

**Alternative to (a) starting from both sides**
The usual method can be marked like this

M1 Uses correct identities for both \(\tan A\) and \(\tan B\) in the rhs expression. Accept only errors in signs

\[
\tan A + \tan B = \frac{\sin A \sin B}{\cos A \cos B}
\]

M1 Multiplies both numerator and denominator by \(\cos A \cos B\). This can be stated or implied by working. If implied you must have seen at least one term modified on both the numerator and denominator

A1 Completes proof. Starting now from the lhs writes \(\tan (A + B) = \frac{\sin (A + B)}{\cos (A + B)} = \frac{\sin A \cos B + \cos A \sin B}{\cos A \cos B - \sin A \sin B}\)

**And** then states that the lhs is equal to the rhs **Or** hence proven. There must be a statement of closure

**Alternative to (b) from sin and cos**

M1 Writes \(\tan \left( \theta + \frac{\pi}{6} \right) = \frac{\sin \left( \theta + \frac{\pi}{6} \right)}{\cos \left( \theta + \frac{\pi}{6} \right)} = \frac{\sin \theta \cos \frac{\pi}{6} + \cos \theta \sin \frac{\pi}{6}}{\cos \theta \cos \frac{\pi}{6} - \sin \theta \sin \frac{\pi}{6}}\)

M1 Uses the identities \(\sin \left( \frac{\pi}{6} \right) = \frac{1}{2}\) and \(\cos \left( \frac{\pi}{6} \right) = \frac{\sqrt{3}}{2}\) in the rhs of the identity on both numerator and denominator and divides both numerator and denominator by \(\cos \theta\) to produce an identity in \(\tan \theta\)

A1 As in original scheme

**Alternative solution for c.** Starting with \(1 + \sqrt{3} \tan \theta = (\sqrt{3} - \tan \theta) \tan (\pi - \theta)\)

Let \(\tan \theta = t\)

\[
1 + \sqrt{3} t = (\sqrt{3} - t)(-t)
\]

\[
t^2 - 2\sqrt{3} t - 1 = 0
\]

\[
t = \frac{2\sqrt{3} \pm \sqrt{(12 + 4)}}{2}
\]

\[
= \sqrt{3} \pm 2
\]

Must find an exact surd
\[ \theta = \frac{5\pi}{12}, \frac{11\pi}{12} \]

Accept the use of a calculator for the A marks as long as there is an exact surd for the solution of the quadratic and exact answers are given.

M1 Starting with \( 1 + \sqrt{3} \tan \theta = (\sqrt{3} - \tan \theta) \tan(\pi - \theta) \) expand \( \tan(\pi - \theta) \) by the correct compound angle identity (or otherwise) and substitute \( \tan(\pi) = 0 \) to produce an equation in \( \tan \theta \).

dM1 Collect terms and produce a 3 term quadratic in \( \tan \theta \).

ddM1 Correct use of quadratic formula to produce exact solutions to \( \tan \theta \). All previous marks must have been scored.

dddM1 All 3 previous marks must have been scored. This is for producing two exact values for \( \theta \).

A1 One solution \( \frac{5\pi}{12} \) (accept \( \frac{\pi}{2} \cdot A \) or \( \frac{11\pi}{12} \)).

A1 Both solutions \( \frac{5\pi}{12} \) (accept \( \frac{\pi}{2} \cdot A \)) and \( \frac{11\pi}{12} \) and no extra solutions inside the range. Ignore extra solutions outside the range.

**Special case:** Watch for candidates who write \( \tan(\pi - \theta) = \tan(\pi) - \tan(\theta) = -\tan(\theta) \) and proceed correctly. They will lose the first mark but potentially can score the others.

**Solutions in degrees**

Apply as before. Lose the first correct mark that would have been scored-usually 75°.
